# Practice Worksheet – Q011 – Employee Loss of Pay (LOP) System

Implement a payroll deduction engine computing Loss of Pay (LOP) deductions, tracking monthly paid leave allowances, and calculating net disbursed salary.

### KEY LEARNING OBJECTIVES:

- Compute pro-rata salary deductions based on unpaid leaves.
- Apply SOLID object-oriented design principles and access control.
- Implement defensive parameter validation and error-free edge handling.
- Verify correctness with standard JUnit test assertions and execution logs.

### STEP-BY-STEP WORKSHEET INSTRUCTIONS:

**Step 1:** Review the business domain requirements and model the class structure.
**Step 2:** Implement private attributes, constructor overloading, and accessors.
**Step 3:** Implement the core computation and validation methods in clean Java.
**Step 4:** Document test execution examples and verify edge-case behavior.

## EXERCISE 11.1: DOMAIN MODELING & CLASS ARCHITECTURE (LEAVE BALANCE TRACKING)

**Problem Statement:** Define the core class architecture for Q011 – Employee Loss of Pay (LOP) System. Establish private attributes, access modifiers, constructors, and encapsulated getter/setter methods with precondition checks.

**Reference Baseline / Scenario / Code:**

```
public class Q011_Employee_LOP_Management_System { private double amount; ... }
```

**STUDENT SOLUTION & CODE WORKSPACE:**

**[1] Class Attributes & Modifiers:** _____

**[2] Constructor Implementation:** _____

**[3] Encapsulation & Preconditions:** _____

## EXERCISE 11.2: CORE BUSINESS LOGIC & COMPUTATION (PRO-RATA DAY RATE FORMULA)

**Problem Statement:** Implement the core algorithmic method for Q011 – Employee Loss of Pay (LOP) System. Formulate the calculation logic, boundary edge validations, and state updates.

**Reference Baseline / Scenario / Code:**

```
public double computeResult() { // Algorithm logic for Q011 – Employee Loss of Pay (LOP) System return calculatedValue; }
```

**STUDENT SOLUTION & CODE WORKSPACE:**

**[1] Algorithm Steps & Formula:** _____

**[2] Conditional Branching Rules:** _____

**[3] Method Implementation Code:** _____

## EXERCISE 11.3: EDGE-CASE HANDLING & BOUNDARY SAFEGUARDS (NET SALARY DISBURSAL LOGIC)

**Problem Statement:** Identify 3 critical edge cases for Q011 – Employee Loss of Pay (LOP) System (e.g. zero values, negative numbers, extreme thresholds). Implement defensive guard clauses and error handling.

**Reference Baseline / Scenario / Code:**

```
if (value <= 0) throw new IllegalArgumentException("Invalid input value");
```

**STUDENT SOLUTION & CODE WORKSPACE:**

**[1] Edge-Case Boundary Matrix:** _____

**[2] Defensive Guard Clauses:** _____

**[3] Validation Logic Implementation:** _____

## EXERCISE 11.4: TESTING & VERIFICATION EXECUTION (UNPAID LEAVE BOUNDARY VERIFICATION)

**Problem Statement:** Construct a JUnit 5 test method verifying that Q011 – Employee Loss of Pay (LOP) System computes expected results accurately across normal, boundary, and invalid scenarios.

**Reference Baseline / Scenario / Code:**

```
@Test void testCalculation() { assertEquals(expected, service.compute(input)); }
```

**STUDENT SOLUTION & CODE WORKSPACE:**

**[1] JUnit 5 Test Annotations:** _____

**[2] Assertion Statements:** _____

**[3] Verification Output Log:** _____

### SELF-REVIEW & VERIFICATION CHECKLIST:

- [ ] **Encapsulation & Access:** All fields private; access mediated by validated methods.
- [ ] **Algorithmic Correctness:** Business logic computes exact expected outputs across all slabs.
- [ ] **Edge Safeguards:** Defensively guards against zero, negative, and extreme inputs.
- [ ] **Code Standards:** Adheres to standard Java naming conventions and clean code practices.
- [ ] **Test Verification:** JUnit test assertions verify deterministic execution.

### CRITICAL REFLECTION & LEARNING SYNTHESIS:

- *How does encapsulation protect the internal state of Q011 – Employee Loss of Pay (LOP) System from unauthorized external corruption?*
- *Why is it essential to test boundary values at the exact tariff or discount transitions?*

**Reflection Notes:**

_____

_____
